

Message Blast

Message blasts are an affordable web-based SMS texting service that allows you to send text messages easily and simultaneously to a large number of cell phone users utilizing an automated messaging system. A 'Message blast/text blast' is an SMS text message sent from a single source to a large group of people simultaneously. Most often used in the retail industry, sending a text message blast has been identified as the most effective way for businesses to connect with customers, raise brand awareness, and increase purchasing intent.

What is Message Blast?

At least 10-15 text messages will enter the mobile in a row. One can send at most 100 messages at the same time. Sometimes fraudsters send so many messages in one go.

What are the apps/website that people use to do these pranks?

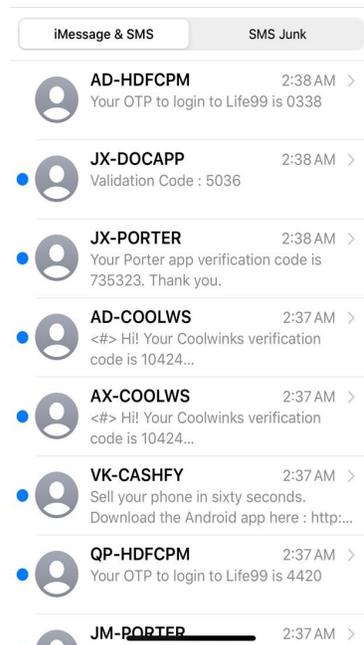

Usually first preference of the people is to use an app or a website for these kind of pranks. **BOMBITUP** (<https://www.bombitup.net/>). It is a very famous app among college students for doing such pranks with their friends. Although this app is not available is on AppStore so you have to install it with the APK is available on their website. Downloading such kinds of APKs from a third-party source is very dangerous as it can contain rootkits. Now a day it is used hugely for message blast to perform cyber fraud.

How does this message explode?

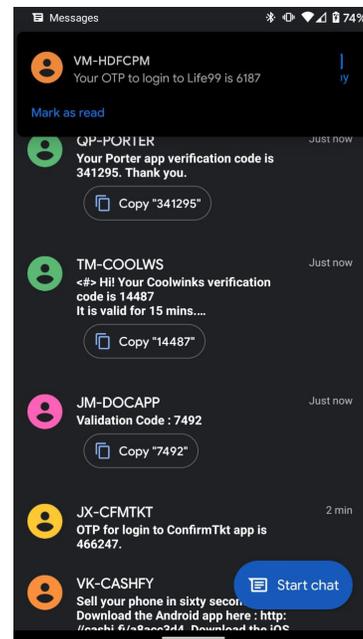

According to cyber experts, this type of message blast application or app is available in Google search engine. By downloading that app, you can write your own content and send it to many people at once. However, these apps are not available in the Play Store.

How to cheat?

The cheaters initially confuse the common people by sending SMS one after the other. The net of deception is hidden in that link. Clicking on the link will take you to your mobile into a remote system. Whatever you do on your mobile, the cheater will see everything. Fraudsters can even snatch information from mobile phones. In many cases, these messages explode and send malware.

How to stop such spam text messages

1. Don't respond.

No matter how annoying it is to receive text messages from random numbers, do not respond to them.

2. Block numbers.

A simple way to keep spam text messages out of your inbox is to block spam numbers on your phone.

3. Report spam messages to your mobile network provider.

mobile service providers are also getting better at identifying and shutting down spam phone numbers and SMSs .

4. Use spam-blocking apps/website.

use an app to proactively block text messages from scammers and spam phone numbers. Here are three of the best spam-blocking Android apps:

- Call Blacklists
- Key Messages
- Call Controls

Best text blocking apps for iPhone

- Hiya
- VeroSMS
- SMS Shield

We may use some online website to protect our mobile numbers. They provides protection for a certain duration of Time.

5. Don't click on links in messages you receive.

Never click on any link in a text message or email unless it comes from a trusted source.

6. Protect your personal info.

Legitimate companies won't ask for sensitive personal information. Keep your personal data private or you risk becoming a victim of identity theft.

7. Review your mobile bill regularly.

Some spam advertising campaigns and other mobile scams force your cell phone to call or text premium numbers, thereby running up your bill. Review your mobile statements and look for any unusually high charges, unexpected data usage, or anything unusual.

8. Use your phone's built-in spam-blocking features.

Check your phone's security settings and use any built-in privacy features like call blocking, caller ID, spam filters, and any other anti-spam controls to help block unwanted text messages, spear phishing attempts, or other scams.
